

A DATA PRODUCT STRATEGY

Shift the system of record right.

Your operational systems were never built to answer questions. Stop treating them as where truth lives. Publish truth as governed data products in the lakehouse — and let that become the record your enterprise actually consumes.

EXECUTIVE SUMMARY

Every analytical, AI and regulatory workload in your enterprise re-extracts and re-interprets the same source systems — thousands of pipelines, each a private, ungoverned copy of the truth. The fix is not more pipelines. It is a **shift-right strategy**: move the authoritative, consumable record into contract-bound data products in the lakehouse. The ERP still captures transactions; the data product becomes the record everyone reads. One governed publication replaces a thousand private extractions.

THE STATUS QUO IS THE RISK

"Shift left" told producers to fix quality at the source. A decade on, the source systems haven't changed — because they can't. They are optimised for transactions, owned by vendors, and frozen by process. Meanwhile consumption exploded rightward: BI, ML, agents, regulators. The result:

Semantic drift

Every notebook re-derives "customer" and "revenue" differently. There is no record — only copies.

Ungoverned sprawl

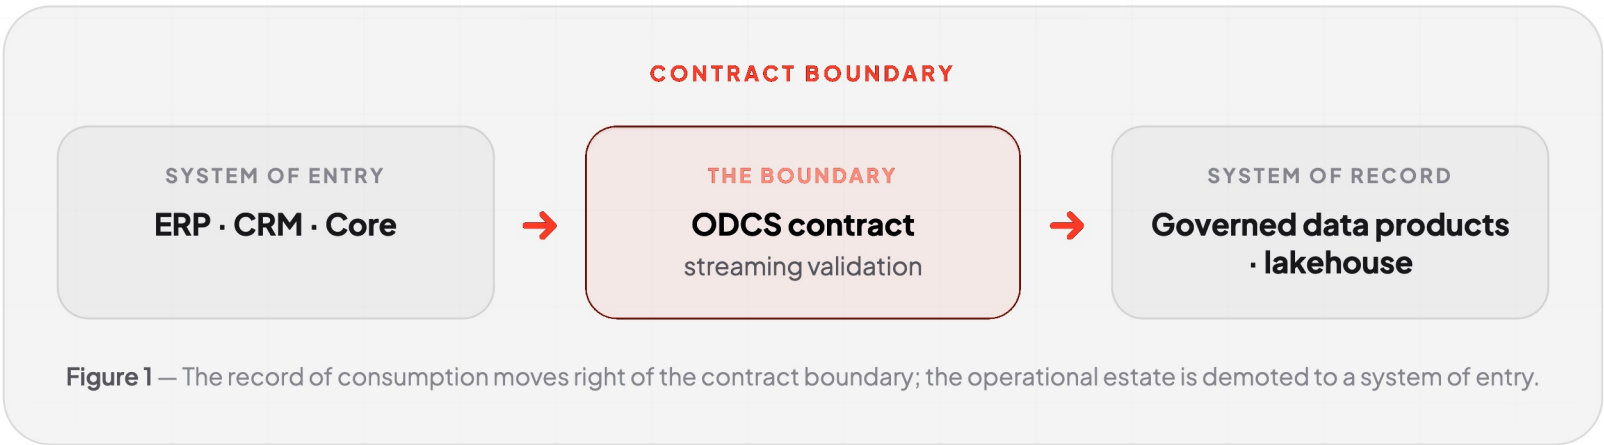

Lineage ends at the extract. Audit means archaeology.

AI on sand

The problem is not the AI solution you are trying to implement. It is the quality of your data.

THE OPERATING MODEL — THE RECORD MOVES RIGHT

A data product is a versioned, contract-bound publication: schema, semantics, quality thresholds and ownership agreed up front in an Open Data Contract Standard (ODCS) contract, enforced on every streaming record — human in the loop on every exception. Once the contract holds, the product is more trustworthy than any private read of the source. The system of record has shifted right.

WHAT CHANGES FOR THE CDO

Own products, not pipelines

Fund named data products with contracts and SLAs. Retire point-to-point extraction as products absorb their consumers.

Governance moves into the flow

Quality is enforced at the contract boundary on every incremental change — not inspected after the fact.

Audit by construction

Before-and-after files, lineage and versioned contracts make the shifted record defensible to any regulator.

From system of record to lakehouse in hours.

QBricks: automated, governed, incremental ingestion — one publication that replaces a thousand private extractions.
